The work to improve the product quality we do in three main directions:

- First – tight control over observance of all workers the producers discipline with the personnel responsibility of each workers and with the use of the different motivate forms of qualitative labour.
- Second direction – the steady technical re-equipment with the purchase of the most modern facility. There are, first of all, “flexible” technological complexes with computer processing and control that in several times enable to increase the efficiency with simultaneous growth of accuracy and reliability of the parts by cost savings. In addition, such equipments give us an opportunity to produce in the same time the different machine models, quickly pass from one model to another.
- At the end, third one – the right choice of the suppliers of componentry. The production volume itself makes the suppliers to compete with each other for being the partners of PA “Gomselmash”. But, of course, we always follow the quality of bought articles and work with the suppliers. If there are facts of quality decrease and we can` t change the situation, we will change a partner without hesitation.

The production of reliable and modern machinery with label PALESSE is approved with the management system of designing quality, manufacture and engineering service of enterprise products certified with the correspondence of the new standard version STB ISO 9001-2009. According to the test results EU certificates have been gotten on the main types of the enterprise machinery, including new models of combine harvesters and forage harvesters.
